

Use the B method to specify a system that manages companies and their employees. A *company* is recorded in the system with its *name*, and an *employee* with its unique *identifier*, *name*, *studies* (*elementary*, *secondary* or *higher*) and *salary*. To each type of studies there corresponds a maximum salary that an employee with those studies can earn. A company can have 0 or more employees, while an employee has a unique employer company. The system should provide operations for creating, destroying, modifying and accessing companies and employees.
